

Business Requirements Document (BRD)

Project Title: FHIR Repository and Patient Access API Implementation

Prepared By: [Your Name]

Date: [Insert Date]

1. Project Overview

CMS has mandated the implementation of FHIR-based APIs to enable patient access to their health data and support interoperability. This project aims to build a FHIR repository leveraging existing patient data from the Member Data Warehouse, transform it into FHIR-compliant format, and expose it via REST APIs to patients, third-party applications, and other payers. The initial scope is limited to patient demographic data only.

2. Business Objectives

- Comply with CMS Interoperability and Patient Access Final Rule.
- Provide patients secure, real-time access to their demographic and contact information.
- Enable data exchange with other payers for continuity of care.
- Establish a FHIR repository for future expansion to claims and clinical data.

3. Scope

In Scope:

- Patient demographic data (name, DOB, gender)
- Patient addresses and contact information
- Build FHIR repository using HL7® FHIR® R4 standards
- Develop RESTful APIs for Patient Access and Payer-to-Payer Data Exchange

Out of Scope (Phase 1):

- Claims, encounter, and clinical data
- OAuth 2.0 and TLS encryption
- Mobile app development

4. Functional Requirements

- FR1: Extract patient demographic data from Member Data Warehouse
- FR2: Transform data into FHIR-compliant Patient Resource format
- FR3: Store transformed data in a FHIR repository
- FR4: Develop RESTful APIs to retrieve patient demographic data
- FR5: Provide API documentation for third-party developers

5. Non-Functional Requirements

- **Performance:** API response time < 2 seconds for standard queries
- **Scalability:** Support up to [X] concurrent API calls
- **Compliance:** HL7® FHIR® R4 standards

6. Assumptions

- Member Data Warehouse contains accurate and up-to-date patient demographic data
- IT team has access to FHIR libraries and frameworks

7. Risks

- Data quality issues in source systems
- Integration challenges with legacy systems

8. Deliverables

- FHIR repository with patient demographic data
- RESTful APIs for patient data access
- API documentation and developer guide

9. Timeline

- Phase 1: Requirements & Design – [Insert Date]
- Phase 2: Development – [Insert Date]
- Phase 3: Testing & Deployment – [Insert Date]
